## CS321 Week 4: Context-Free Grammars

Jingke Li, Portland State University

Winter 2014

CS321 Week 4: Context-Free Grammars

Winter 2014

1 / 31

# Today's Topics

- ► Context-free grammars
- ▶ Derivations and parse trees
- ► Ambiguity and recursions
- ► Equivalence and transformations

#### Next Two Weeks:

- ► Top-down parsing
- ► Bottom-up parsing

CS321 Week 4: Context-Free Grammars

Winter 2014

## Language Specifications

To process a language, we need specifications for all its components: words, sentence structures, semantics, etc.

While specifications can come in many different forms, to compilers, we want the specifications be both *precise* and *concise*.

Formal systems for programming language specifications:

- lexical tokens regular expressions
- syntax structures context-free grammars
- ▶ semantics denotation, abstract machine, or logic axioms

CS321 Week 4: Context-Free Grammars

Winter 2014

3 / 31

### Formal Grammars

Grammar is a system of rules that defines the syntactical structure of a language. (Merriam-Webster.com)

A *formal grammar* is used to define the syntactical structure of a formal language, It consists of the following components:

- ▶ A finite set of *terminals* symbols that form sentences.
- ▶ A finite set of *nonterminals* variables that can be extended to sentences by the grammar rules.
  - ▶ One of the nonterminals is designated as the *start symbol*.
- A finite set of productions grammar rules of the form "lhs → rhs", where lhs and rhs are sequences of terminals and nonterminals, with lhs containing at least one nonterminal. The productions specify the relationship between terminals and nonterminals, and how they should be combined to form sentences.

CS321 Week 4: Context-Free Grammars

Winter 2014

## Chomsky Hierarchy

- Unrestricted Grammars:  $\alpha A\beta \rightarrow \gamma$ 
  - ▶ Generate recursively enumerable languages
- Context-Sensitive Grammars:  $\alpha A\beta \rightarrow \alpha \gamma \beta$ 
  - ► Generate *context-sensitive* languages
- ► Context-Free Grammars:  $A \rightarrow \gamma$ 
  - Generate context-free languages
     (which include most programming languages)
- ▶ Regular Grammars:  $A \rightarrow a$  or  $A \rightarrow aB$ 
  - ► Generate *regular* languages, i.e. regular expressions

CS321 Week 4: Context-Free Grammars

Winter 2014

5 / 31

## Context-Free Grammars (CFGs)

A CFG is defined by

- $\triangleright$  A finite set of terminals  $V_t$ 
  - ▶ For a PL, terminals are just tokens recognized by the lexer
- $\triangleright$  A finite set of nonterminals  $V_n$ , including a start symbol S
- ▶ A finite set of productions of the form

$$A \rightarrow x_1 \cdots x_m$$
 where  $A \in V_n, \ x_i \in V_n \cup V_t$ 

Backus-Naur Form (BNF):

BNF is a particular notation for CFGs. It was first used in the formal description of Algol 60. The notation convention has evolved through the years; current convention include:

- ▶ Nonterminals begin with upper-case letters.
- ► Terminals are quoted. However, terminals that do not correspond to literal characters or strings can be represented as they are.

CS321 Week 4: Context-Free Grammars

Winter 2014

#### Extended BNF

EBNF is any extension of BNF, usually with the following features:

- ► A vertical bar, |, represents a choice,
- Parentheses, ( and ), represent grouping,
- Square brackets, [ and ], represent an optional construct,
- ► Curly braces, { and }, represent zero or more repetitions,

EBNF does not have extra power than BNF. In fact, any grammar in EBNF can be transformed into one in proper BNF.

CS321 Week 4: Context-Free Grammars

Winter 2014

7 / 31

## An Original (Algol 60-Style) BNF Example

```
⟨program⟩ ::= begin ⟨statement list⟩ end
  ⟨statement list⟩ ::= ⟨statement⟩ ⟨statement list⟩
  ⟨statement list⟩ ::= ⟨statement⟩
       ⟨statement⟩ ::= ⟨assignment⟩
       ⟨statement⟩ ::= ⟨read statement⟩
       ⟨statement⟩ ::= ⟨write statement⟩
      \langle assignment \rangle ::= ID := \langle expression \rangle;
⟨read statement⟩ ::= read ( ⟨id list⟩ );
⟨write statement⟩ ::= write (⟨expr list⟩);
             ⟨id list⟩ ::= ID , ⟨id list⟩
             \langle id \ list \rangle ::= ID
          ⟨expr list⟩ ::= ⟨expression⟩ , ⟨expr list⟩
          \langle expr | list \rangle ::= \langle expression \rangle
       \langle expression \rangle ::= \langle primary \rangle + \langle expression \rangle
       \langle expression \rangle ::= \langle primary \rangle - \langle expression \rangle
       \langle expression \rangle ::= \langle primary \rangle
           \langle primary \rangle ::= (\langle expression \rangle)
           ⟨primary⟩ ::= ID
           ⟨primary⟩ ::= INTEGER
```

CS321 Week 4: Context-Free Grammars

Winter 2014

## A Corresponding Modern Version

```
Program → "begin" StmtList "end"
   StmtList \rightarrow Statement StmtList
   \mathsf{StmtList} \to \mathsf{Statement}
 \mathsf{Statement} \to \mathsf{Assignment}
 \mathsf{Statement} \to \mathsf{ReadStmt}
 \mathsf{Statement} \to \mathsf{WriteStmt}
Assignment \rightarrow id ":=" Expression ";"
 \mathsf{ReadStmt} \to \mathsf{"read"} \;\; \mathsf{"("} \;\; \mathsf{IdList} \;\; \mathsf{")"} \;\; \mathsf{";"}
 WriteStmt \rightarrow "write" "(" ExprList ")" ";"
        IdList \rightarrow id "," IdList
        \mathsf{IdList} \to \mathsf{id}
    \mathsf{ExprList} \to \mathsf{Expression} "," \mathsf{ExprList}
    \mathsf{ExprList} \to \mathsf{Expression}
 Expression → Primary "+" Expression
 Expression → Primary "—" Expression
 Expression \rightarrow Primary
     Primary \rightarrow "(" Expression ")"
     Primary \rightarrow id
     Primary \rightarrow integer
```

CS321 Week 4: Context-Free Grammars

Winter 2014 9

9 / 31

## A Corresponding EBNF

```
\begin{array}{l} \mathsf{Program} \to \text{``begin''} \; \mathsf{StmtList} \; \text{``end''} \\ \mathsf{StmtList} \to \mathsf{Statement} \; \big\{ \; \mathsf{Statement} \; \big\} \\ \mathsf{Statement} \to \mathsf{Assignment} \; \big| \; \mathsf{ReadStmt} \; \big| \; \mathsf{WriteStmt} \\ \mathsf{Assignment} \to \mathsf{id} \; \text{``:=''} \; \mathsf{Expression} \; \text{``;''} \\ \mathsf{ReadStmt} \to \; \text{``read''} \; \text{``(''} \; \mathsf{IdList} \; \text{`')''} \; \text{``;''} \\ \mathsf{WriteStmt} \to \; \text{``write''} \; \text{``(''} \; \mathsf{ExprList} \; \text{`')''} \; \text{``;''} \\ \mathsf{IdList} \to \mathsf{id} \; \big\{ \; \text{``,''} \; \mathsf{id} \; \big\} \\ \mathsf{ExprList} \to \; \mathsf{Expression} \; \big\{ \; \text{``,''} \; \mathsf{Expression} \; \big\} \\ \mathsf{Expression} \to \; \mathsf{Primary} \; \big\{ \; \big(\text{``+''} \; \big| \; \text{``-''} \big) \; \mathsf{Primary} \; \big\} \\ \mathsf{Primary} \to \; \text{``(''} \; \mathsf{Expression} \; \text{``)''} \; \big| \; \mathsf{id} \; \big| \; \mathsf{integer} \\ \end{array}
```

CS321 Week 4: Context-Free Grammars

Winter 2014

## Transforming EBNF to BNF

#### Rules:

$$A \to \alpha [\beta] \gamma \qquad \Rightarrow \qquad A \to \alpha B \gamma$$

$$B \to \beta$$

$$B \to \epsilon$$

$$A \to \alpha B \gamma$$

$$A \to \alpha \{\beta\} \gamma \qquad \Rightarrow \qquad \qquad B \to \beta B \\ B \to \epsilon$$

#### Example:

CS321 Week 4: Context-Free Grammars

Winter 2014

11 / 31

### Language Defined by a Grammar

The set of sentences derived from the start symbol S of a grammar G by repeatedly applying the production rules defines the language of the grammar, denoted L(G):  $L(G) = \{x \in V_t^* \mid S \stackrel{+}{\Rightarrow} x\}.$ 

A *derivation* step is to replace the lhs of a production by its rhs.

#### Example:

$$(1) E \to E + T \qquad E \stackrel{(1)}{\Rightarrow} E + T \stackrel{(2)}{\Rightarrow} T + 7$$

(1) 
$$E \rightarrow E + T$$
  $E \stackrel{\text{(1)}}{\Rightarrow} E + T \stackrel{\text{(2)}}{\Rightarrow} T + T$   
(2)  $E \rightarrow T$   $\stackrel{\text{(3)}}{\Rightarrow} T * P + T \stackrel{\text{(4)}}{\Rightarrow} P * P + T$   
(4)  $T \rightarrow P$   $\stackrel{\text{(5)}}{\Rightarrow} \text{id} * P + T \stackrel{\text{(5)}}{\Rightarrow} \text{id} * \text{id} + T$ 

$$(3) \quad T \to T * P$$

$$(4) \quad T \to P$$

$$\stackrel{(5)}{\Rightarrow} \text{ id } * P + T \stackrel{(5)}{\Rightarrow} \text{ id } * \text{id} + T$$

$$(5) P \rightarrow id \qquad \qquad \stackrel{(4)}{\Rightarrow} id * id + P \stackrel{(5)}{\Rightarrow} id * id + id$$

#### **Notations:**

one derivation step  $\Rightarrow$ 

one or more steps

zero or more steps

Note: When context is clear, we omit quotes around terminal symbols in our examples.

CS321 Week 4: Context-Free Grammars

Winter 2014

#### **Derivations**

A sentence can be derived by different sequences of productions.

#### Example (Revisit):

(1) 
$$E \rightarrow E + T$$

(2) 
$$E \rightarrow T$$

(3) 
$$T \rightarrow T * P$$

(4) 
$$T \rightarrow P$$

(5) 
$$P \rightarrow id$$

$$(1) \ E \to E + T \qquad \qquad E \stackrel{(1)}{\Rightarrow} E + T \stackrel{(2)}{\Rightarrow} T + T$$

$$\overset{\text{(3)}}{\Rightarrow} T * P + T \overset{\text{(4)}}{\Rightarrow} P * P + T$$

$$\stackrel{(5)}{\Rightarrow}$$
 id \*  $P + T \stackrel{(5)}{\Rightarrow}$  id \* id +  $T$ 

$$\stackrel{\text{(4)}}{\Rightarrow}$$
 id \* id + P  $\stackrel{\text{(5)}}{\Rightarrow}$  id \* id + id

Two alternative derivation sequences:

$$E \stackrel{(1)}{\Rightarrow} E + T \stackrel{(2)}{\Rightarrow} T + T$$

$$\stackrel{(3)}{\Rightarrow} T * P + T \stackrel{(4)}{\Rightarrow} P * P + T \qquad \stackrel{(5)}{\Rightarrow} E + id \stackrel{(2)}{\Rightarrow} T + id$$

$$\stackrel{\text{(4)}}{\Rightarrow} P * P + P \stackrel{\text{(5)}}{\Rightarrow} P * P + \text{id}$$

$$\stackrel{(5)}{\Rightarrow} P * id + id \stackrel{(5)}{\Rightarrow} id * id + id$$

$$E \stackrel{(1)}{\Rightarrow} E + T \stackrel{(2)}{\Rightarrow} T + T$$
  $E \stackrel{(1)}{\Rightarrow} E + T \stackrel{(4)}{\Rightarrow} E + P$ 

$$\stackrel{(5)}{\Rightarrow} E + id \stackrel{(2)}{\Rightarrow} T + id$$

$$\stackrel{\text{(4)}}{\Rightarrow} P*P+P \stackrel{\text{(5)}}{\Rightarrow} P*P+ \text{id} \qquad \stackrel{\text{(3)}}{\Rightarrow} T*P+ \text{id} \stackrel{\text{(4)}}{\Rightarrow} P*P+ \text{id}$$

$$\overset{(5)}{\Rightarrow} P * \mathrm{id} + \mathrm{id} \overset{(5)}{\Rightarrow} \mathrm{id} * \mathrm{id} + \mathrm{id} \qquad \overset{(5)}{\Rightarrow} \mathrm{id} * P + \mathrm{id} \overset{(5)}{\Rightarrow} \mathrm{id} * \mathrm{id} + \mathrm{id}$$

CS321 Week 4: Context-Free Grammars

13 / 31

### **Derivations of Compiler Interests**

- ▶ Left-Most Derivation  $(\Rightarrow_{lm}, \Rightarrow_{lm}, \Rightarrow_{lm})$ : Always choose the left-most nonterminal to expand.
- ▶ Right-Most Derivation ( $\Rightarrow_{rm}$ ,  $\overset{*}{\Rightarrow}_{rm}$ ,  $\overset{*}{\Rightarrow}_{rm}$ ): Always choose the right-most nonterminal to expand.

### Example:

$$S \rightarrow S$$
;  $S \mid id := E \mid print (E)$ 

$$E \rightarrow id \mid num$$

$$\underline{S} \Rightarrow_{lm} \underline{S}; S 
\Rightarrow_{lm} id := \underline{E}; S 
\Rightarrow_{lm} id := num; S$$

$$\Rightarrow_{lm}$$
 id := num ; print (  $\underline{E}$  )  $\Rightarrow_{lm}$  id := num ; print ( id )

$$\begin{array}{l} \underline{S} \Rightarrow_{rm} S; \underline{S} \\ \Rightarrow_{rm} S; \text{ print } (\underline{E}) \\ \Rightarrow_{rm} \underline{S}; \text{ print } (\text{ id }) \\ \Rightarrow_{rm} \text{ id } := \underline{E}; \text{ print } (\text{ id }) \end{array}$$

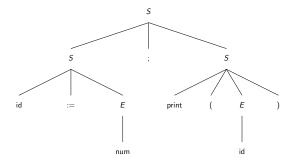

$$\Rightarrow_{rm}$$
 id := num; print ( id )

#### Parse Tree

A tree representation of the derivation from the start symbol to a sentence, a.k.a. concrete syntax tree.

- ▶ root the start symbol
- ▶ internal nodes nonterminals
- ► *leaf nodes* terminals

Both the left-most derivation and the right-most derivation are linear representations of a parse tree.

CS321 Week 4: Context-Free Grammars

Winter 2014

15 / 31

## Ambiguity in Grammars

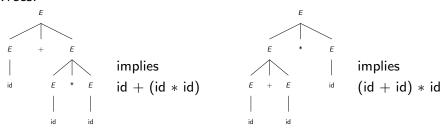

Sometimes, multiple parse trees can be derived from a grammar for the same sentence.

Example 1: Arithmetic expressions

Grammar:  $E \rightarrow E + E \mid E * E \mid (E) \mid - E \mid id$ 

Sentence: id + id \* id

Parse Trees:

A grammar is said to be *ambiguous* if it can derive some sentence with more than one parse tree.

▶ Parsers can not be built with an ambiguous grammar!

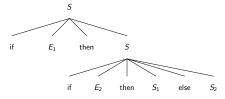

## Ambiguity in Grammars (cont.)

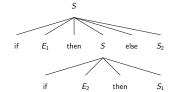

Example 2: The "Dangling Else"

*Grammar:*  $S \rightarrow \text{if } E \text{ then } S \mid \text{if } E \text{ then } S \text{ else } S \mid \text{ other}$ 

Sentence: if  $E_1$  then if  $E_2$  then  $S_1$  else  $S_2$ 

Parse Trees:

Implied semantics:

if  $E_1$  then { if  $E_2$  then  $S_1$  else  $S_2$  } if  $E_1$  then { if  $E_2$  then  $S_1$  } else  $S_2$ 

CS321 Week 4: Context-Free Grammars

Winter 2014

17 / 31

### Recursion in Grammars

Recursion in productions is necessary for any non-trivial CFGs. (Why?) Recursions can appear in different positions in a production:

$$P \rightarrow aPb \mid Pcd \mid eP \mid f$$
  
 $S \rightarrow Aa \mid b$ 

 $A \rightarrow Ac \mid Sd \mid e$ 

Of Compiler Interests:

- ▶ *Left-recursion:*  $E \stackrel{+}{\Rightarrow} E\alpha$  for some string  $\alpha$ .
  - ▶ Immediate form::  $E \rightarrow E + id$
  - General form:  $E \rightarrow F, F \rightarrow E + id$
- ► *Right-recursion:*  $E \stackrel{+}{\Rightarrow} \alpha E$  for some string  $\alpha$ .
  - ▶ Immediate form::  $E \rightarrow id + E$
  - General form:  $E \rightarrow G$ ,  $G \rightarrow id + E$

Grammars with left-recursive productions are not suitable for the predictive parsing method (i.e. top-down parsing).

### Equivalence of Grammars

As shown earlier, each grammar G defines a single language L(G).

However, the reverse is not true. For a given language L, there can be multiple grammars that define it. I.e., we can have  $G_1, G_2, G_3, \cdots$  that

$$L = L(G_1) = L(G_2) = L(G_3) = \cdots$$

#### Example 1:

 $G_1$ :  $S \rightarrow S \times | \epsilon$ 

 $G_2$ :  $S \rightarrow x S \mid \epsilon$ 

Both define the language  $x^*$ .

#### Example 2:

 $G_1$ :  $E \rightarrow E + E \mid E - E \mid id (ambiguous!)$ 

 $G_2$ :  $E \rightarrow E + id \mid E - id \mid id$ 

Both define the set of binary expressions with + and -.

CS321 Week 4: Context-Free Grammars

Winter 2014

19 / 31

### **Grammar Transformations**

For writing parsers, it is often necessary to transform a given grammar to an equivalent, but more parser-friendly grammar.

### Examples:

- ▶ Elimination of ambiguity
- Elimination of left recursion
- Left factoring

## Elimination of Ambiguity

Approach 1: Rewrite grammar with operator precedence.

### Example:

Precedence (from high to low): unary -, \*, +.

1. 
$$E \rightarrow E + E$$

$$2. \quad E \rightarrow E * E$$

3. 
$$E \rightarrow -E$$

4. 
$$E \rightarrow (E)$$

5. 
$$E \rightarrow id$$

1. 
$$E \rightarrow E + T$$

2. 
$$E \rightarrow T$$

3. 
$$T \rightarrow T * P$$

$$\Rightarrow$$
 4.  $T \rightarrow P$ 

5. 
$$P \rightarrow -P$$

6. 
$$P \rightarrow (E)$$

7. 
$$P \rightarrow id$$

CS321 Week 4: Context-Free Grammars

Winter 2014

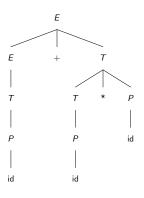

21 / 31

## Operator Precedence Example (cont.)

Sentence: id + id \* id

Before: multiple parse trees

After: unique parse tree

CS321 Week 4: Context-Free Grammars

Winter 2014

# Eliminating Ambiguity (cont.)

Approach 2: Rewrite grammar with more syntactic constraints.

Example:

$$S \rightarrow \text{if } E \text{ then } S \mid \text{if } E \text{ then } S \text{ else } S \mid \text{ other}$$

 $\Rightarrow$ 

$$S \rightarrow m_S \mid unm_S$$

 $m_-S \rightarrow \text{if } E \text{ then } m_-S \text{ else } m_-S \mid other$ 

 $unm_-S \rightarrow if E then S \mid if E then m_-S else unm_-S$ 

CS321 Week 4: Context-Free Grammars

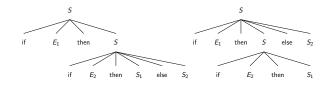

Winter 2014

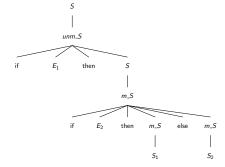

23 / 31

# Syntactic Constraints Example (cont.)

Sentence: if  $E_1$  then if  $E_2$  then  $S_1$  else  $S_2$ 

Before: multiple parse trees After: unique parse tree

CS321 Week 4: Context-Free Grammars

Winter 2014

## Syntactic Constraints Example (cont.)

Details are important. If we change the transformation slightly:

$$S \rightarrow \text{if } E \text{ then } S \mid \text{if } E \text{ then } S \text{ else } S \mid \text{ other}$$

 $\Rightarrow$ 

$$S \rightarrow m\_S \mid unm\_S$$
  
 $m\_S \rightarrow \text{if } E \text{ then } m\_S \text{ else } S \mid other$   
 $unm\_S \rightarrow \text{if } E \text{ then } S$ 

then the resulting grammar is still ambiguous!

CS321 Week 4: Context-Free Grammars

Winter 2014

25 / 31

### Elimination of Left Recursions

Case 1. Simple lists.

Approach: Convert directly.

ightharpoonup A 
igh

Sentence patterns:  $L = \alpha *$ 

Equivalent productions:  $A \rightarrow \alpha A \mid \epsilon$ 

With EBNF operators:  $A \rightarrow \{\alpha\}$ 

 $ightharpoonup A \alpha \mid \beta$ 

Sentence patterns:  $L = \beta \alpha *$ 

Equivalent productions:  $A \rightarrow \beta A'$ 

 $A' \rightarrow \alpha A' \mid \epsilon$ 

With EBNF operators:  $A \rightarrow \beta \{ \alpha \}$ 

CS321 Week 4: Context-Free Grammars

Winter 2014

## Elimination of Left Recursions (cont.)

Case 2. Immediate left recursions.

Approach: Collect all productions for a given nonterminal; group them into left-recursive ones, and non-left-recursive ones.

 $\blacktriangleright$   $A \rightarrow A\alpha_1 \mid A\alpha_2 \mid \cdots \mid A\alpha_m \mid \beta_1 \mid \beta_2 \mid \cdots \mid \beta_n$ 

Grouping and factoring:

$$A \rightarrow A(\alpha_1 \mid \alpha_2 \mid \cdots \mid \alpha_m) \mid (\beta_1 \mid \beta_2 \mid \cdots \mid \beta_n)$$

Rewriting:  $A \rightarrow AB \mid C$ 

$$B \rightarrow \alpha_1 \mid \alpha_2 \mid \cdots \mid \alpha_m$$

 $C \rightarrow \beta_1 \mid \beta_2 \mid \cdots \mid \beta_n$ 

Sentence patterns: L = C B\*

Equivalent productions:

$$A \rightarrow (\beta_1 \mid \cdots \mid \beta_n)A'$$
  
$$A' \rightarrow (\alpha_1 \mid \cdots \mid \alpha_m)A' \mid \epsilon$$

CS321 Week 4: Context-Free Grammars

Winter 2014

27 / 31

## Elimination of Left Recursions (cont.)

Case 3. General non-immediate left recursions.

Approach: Inline productions to turn general non-immediate left recursions into immediate left recursions; then apply the replacement transformation.

Inlining:  $A \rightarrow A\beta_1\alpha_1 \mid \beta_2\alpha_1 \mid A\gamma_1\alpha_2 \mid \gamma_2\alpha_2 \mid \alpha_3$ 

Example:

$$E \rightarrow F \mid T$$

$$F \rightarrow E + x \mid E - y \mid P$$

$$\Rightarrow E \rightarrow E + x \mid E - y \mid P \mid T$$

$$F \rightarrow E + x \mid E - y \mid P$$

$$\Rightarrow E \rightarrow P E' \mid T E'$$

$$\Rightarrow E' \rightarrow + x E' \mid -y E' \mid \epsilon$$

$$F \rightarrow E + x \mid E - y \mid P$$

CS321 Week 4: Context-Free Grammars

Winter 2014

## Left Factoring

Productions with common prefix cause problems for predictive parsers:

 $S \rightarrow \text{if } E \text{ then } S \text{ end if } ;$  $S \rightarrow \text{if } E \text{ then } S \text{ else } S \text{ end if } ;$ 

An easy fix is to perform left factoring:

 $S \rightarrow \text{if } E \text{ then } S T$   $T \rightarrow \text{end if } ;$  $T \rightarrow \text{else } S \text{ end if } ;$ 

When the common prefix is not explicit, it is hard to fix.

CS321 Week 4: Context-Free Grammars

Winter 2014

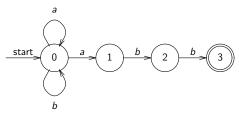

29 / 31

## CFGs vs. Regular Expressions

Every set that can be described by a regular expression can also be described by a context-free grammar.

Example: the R.E.  $(a|b)^*abb$  can be described by

$$\begin{array}{lll} A_0 & \rightarrow & aA_0 \mid bA_0 \mid aA_1 \\ A_1 & \rightarrow & bA_2 \\ A_2 & \rightarrow & bA_3 \\ A_3 & \rightarrow & \epsilon \end{array}$$

Regular Grammars are just context-free grammars with their productions limited to the following two forms,

$$A 
ightarrow aB$$
  $C 
ightarrow \epsilon$ 

## Chomsky Hierarchy Revisit

The Chomsky hierarchies are properly nested, i.e.

Regular languages  $\subset$  CFG languages  $\subset$  CSG languages  $\subset$  R.E. languages

#### Examples:

▶ The language  $\{[i]^i | i \ge 1\}$  is not regular, but it can be defined by a context-free grammar:

$$S \rightarrow [T]$$
$$T \rightarrow [T] \mid \epsilon$$

▶ The following language is not describable by CFG:

$$L = \{wcw \mid w \text{ is in } (a|b)*\}$$

In contrast, the following is a CFG:

$$L' = \{wcw^R \mid w \text{ is in } (a|b)*\}$$

CS321 Week 4: Context-Free Grammars

Winter 2014
